PROCESS IMPROVEMENT I DMAIC IN PRACTICE

Enterprise Learning Quality Transformation

A reactive content-correction process became a proactive, data-driven quality framework.

1,615 to 0	108	25,000+	2+ years
Hidden defects cleared	Content owners enabled	Learning objects checked	Performance sustained

D — DEFINE

Exposed defects that had accumulated undetected over years across distributed teams - hidden issues hurting learner experience, search accuracy, and efficiency.

M — MEASURE

Built automated measurement on data from the learning management system (LMS): six checks on every learning object, refreshed daily.

A — ANALYZE

Found root causes: copy and paste propagation, inconsistent product naming, and no automated validation.

I — IMPROVE

Enabled 108 owners to clear the backlog through owner-specific reports and coaching, backed by automated detection and suggested corrections.

C — CONTROL

Established dashboards, daily monitoring, ownership accountability, standard work, and continuous improvement.

THE AUTOMATED LOOP

Daily LMS extract → Automated validation → Owner reports → Owner corrects → Dashboard monitoring

RESULT

Owners cleared 1,615 surfaced defects to zero in about three months. Automation then held the line for more than two years, even as thousands of new learning objects were added.

DMAIC: Define, Measure, Analyze, Improve, Control. Summary of a longer case study; no proprietary or identifying data is shown.
