INSTRUCTIONAL DESIGN I ADDIE IN PRACTICE

Training Built From the Task

How I design technical training for the people who install, run, and maintain equipment.

Every objective traces to a task. Every test item traces to an objective. That is how the training stays tied to the job.

A — ANALYZE

Start with the job. Work with engineers, subject-matter experts, and installers to list the tasks people perform on the equipment. Find the trainable moments: the steps that differ from the standard and need more practice.

D — DESIGN

Write each objective from a task. Map every test item to an objective, and choose the format the task calls for.

D — DEVELOP

Build what the task needs: procedures and documentation, instructor materials, hands-on exercises and lab guides, web-based courses, and job aids.

I — IMPLEMENT

Deliver it where the work is: instructor-led and hands-on sessions, virtual classes, and web-based training. Prepare other instructors so delivery is the same everywhere.

E — EVALUATE

Test on the tasks. Review an item analysis for every test, survey every course, and change the training based on what the data shows.

FROM TASK TO TEST

TASK
What the installer does on the job: remove and replace a unit in working equipment.

>

OBJECTIVE
Written from that task: using the procedure, remove and replace the unit safely and correctly.

>

TEST
Checked on that task: the installer performs the replacement to the procedure, hands-on.

Illustrative example. The structure reflects how each course was built; the content shown is generic.

WHERE I HAVE APPLIED IT

- Installation training for field technicians
- Technical documentation and procedures
- Hands-on and instructor-led training
- Web-based courses
- Job aids
- Recurring certification training
